

JOURNAL OF HERBAL TECHNOLOGIES

Advancing Science, Technology and Innovation in Herbal Research

1. HOME

Journal of Herbal Technologies

Advancing Science, Technology and Innovation in Herbal Research

Journal of Herbal Technologies (JHT) is a peer-reviewed scholarly journal dedicated to research on medicinal plants, natural products, herbal materials, herbal formulations and the technologies involved in their scientific development.

JHT provides an interdisciplinary platform connecting pharmacognosy, phytochemistry, extraction and processing, standardization, analytical science, formulation and drug delivery, pharmacology, toxicology, biotechnology, computational approaches, product development and regulatory science.

About the Journal

JHT aims to provide a dedicated scientific platform for multidisciplinary research spanning the development of herbal materials and products, from identification and characterization to technological development, biological evaluation, product development and regulatory considerations.

[[Read About JHT](#)]

2. ABOUT THE JOURNAL

About Journal of Herbal Technologies

Journal of Herbal Technologies (JHT) is a peer-reviewed scholarly journal dedicated to advancing research in medicinal plants, natural products, herbal materials, herbal formulations and technologies associated with their scientific development.

The journal brings together research from disciplines involved in the identification, characterization, processing, extraction, standardization, formulation, biological evaluation, technological development and translation of herbal materials and products.

JHT is intended to provide a multidisciplinary platform connecting natural-product research with pharmaceutical sciences, biological sciences, analytical science, technology and regulatory science.

The journal's emphasis extends beyond the simple identification of biological activity. JHT particularly welcomes research that contributes meaningful characterization, methodological advancement, mechanistic understanding, technological development, product development or evidence relevant to reliable herbal products.

Aim

The Journal of Herbal Technologies aims to provide a scientific platform for multidisciplinary research spanning the development pathway of herbal materials and products, from identification and characterization through scientific evaluation, technological development, product development and regulatory considerations.

JHT supports research that connects fundamental herbal science with technologies and methodologies capable of improving the understanding, quality, reproducibility, performance and development of herbal materials and products.

Scope

JHT covers the following eight areas:

1. Pharmacognosy, Botany & Herbal Authentication

Research involving:

- botanical identification and taxonomy;
- pharmacognostic evaluation;
- microscopy and anatomical studies;
- authentication of medicinal plants;
- chemotaxonomy;
- adulteration and substitution;
- herbal material identification and quality evaluation.

Ethnobotanical and ethnomedicinal studies are not a principal focus of the journal unless they contribute meaningfully to the scientific investigation, validation or development of herbal materials or products.

2. Phytochemistry & Natural Products

Research involving:

- phytochemical investigation;
- isolation and characterization of natural products;
- chromatographic and spectroscopic characterization;
- metabolomic and phytochemical profiling;
- bioactive constituents;
- structure-related investigations;
- natural-product interactions and characterization.

3. Herbal Extraction, Processing & Manufacturing Technologies

Research involving:

- conventional and advanced extraction;
- extraction optimization;
- green extraction technologies;
- fractionation and purification;
- processing of herbal materials;
- drying and preservation technologies;
- scale-up and manufacturing-related technologies;
- process optimization and technological development.

4. Standardization, Analytical Science & Quality Control

Research involving:

- analytical method development and validation;
- chromatographic and spectroscopic methods;
- marker-based standardization;
- quality-control methodologies;
- fingerprinting;
- stability studies;
- contaminant and adulterant analysis;
- quality assessment of herbal materials and products.

5. Herbal Formulation & Drug-Delivery Technologies

Research involving:

- herbal dosage forms;
- novel delivery systems;
- nanotechnology and advanced delivery platforms;
- topical, transdermal and mucosal systems;
- controlled and targeted delivery;
- formulation optimization;
- physicochemical characterization;
- in vitro performance and release studies;
- formulation stability and performance evaluation.

6. Pharmacology, Toxicology & Mechanistic Evaluation

Research involving:

- pharmacological evaluation;
- mechanism-of-action studies;
- molecular and cellular investigations;
- efficacy-related studies;
- toxicological evaluation;
- safety assessment;
- pharmacokinetic and pharmacodynamic investigations where relevant;
- scientifically justified biological evaluation of herbal materials and products.

7. Computational, Biotechnological & Emerging Technologies

Research involving:

- computational approaches;
- molecular modelling and related methods;
- network pharmacology;
- bioinformatics;
- artificial intelligence and machine-learning applications;
- biotechnology;
- plant cell and tissue technologies;
- advanced analytical and technological approaches.

Computational studies should have meaningful scientific relevance to herbal research and, where appropriate, biological or experimental support.

8. Herbal Product Development, Clinical Translation & Regulatory Science

Research involving:

- herbal product development;
- product optimization;
- translational research;
- quality-by-design approaches;
- regulatory science;
- quality and safety considerations;
- evidence generation for herbal products;
- clinically relevant development studies;
- regulatory and quality frameworks relevant to herbal products.

Clinical research involving herbal products may be considered where it is scientifically relevant to the journal's scope and meets appropriate ethical and methodological standards.

Scientific Priority

JHT welcomes research from across its scope but maintains scientific selectivity.

The following may receive lower editorial priority where they do not provide sufficient scientific rationale, methodological advancement or meaningful contribution:

- routine preliminary phytochemical screening;
- routine antioxidant or antimicrobial screening without adequate scientific justification;
- poorly characterized herbal materials or extracts;
- descriptive studies with limited scientific contribution;
- formulation studies with minimal novelty or inadequate characterization;
- computational studies without meaningful biological or experimental relevance;
- unsupported therapeutic claims;
- repetitive or substantially incremental studies;
- studies with inadequate methodology, controls or statistical analysis;
- conclusions that extend beyond the evidence presented.

These considerations are part of editorial assessment and do not constitute an automatic exclusion based solely on study category.

What JHT Does Not Aim to Be

JHT is not intended to function simply as a general repository for studies in which a plant, herbal extract or natural product is used as an experimental material.

The journal's distinctive emphasis is the scientific and technological development of herbal materials and products, extending from pharmacognosy and characterization through technology, validation, product development and regulatory considerations.

Journal Information

Journal Title: Journal of Herbal Technologies

Institutional Association

Journal of Herbal Technologies is associated with Oriental College of Pharmacy as an institutional association.

The institution provides academic support and continuity to the journal while maintaining separation between institutional support and individual editorial decisions.

Editorial decisions concerning individual manuscripts are made through the journal's editorial process and are not subject to institutional interference.

3. EDITORIAL BOARD

Editorial Leadership

The editorial structure of JHT is designed to provide clear scientific responsibility while supporting multidisciplinary coverage.

Editor-in-Chief

The Editor-in-Chief provides overall scientific and editorial leadership, oversees editorial policy, maintains journal standards and coordinates the activities of the editorial team.

Associate Editors

Associate Editors support the Editor-in-Chief in manuscript assessment, editorial decisions, reviewer management and development of the journal within their areas of expertise.

Section Editors

Section Editors provide subject-specific editorial oversight across the journal's principal scientific areas.

Section-level editorial appointments will be developed progressively as the journal grows.

Editorial Board Members

Editorial Board Members contribute subject expertise, support peer review and provide scientific guidance for the development of the journal.

Editorial responsibilities and affiliations will be listed transparently on the journal website.

Founding Publisher

Raj Mishra

Krishna Prajapati

The Founding Publisher role relates to the establishment and publishing framework of the journal and is distinct from independent scientific editorial decision-making.

Editorial Independence

JHT is institutionally associated with Oriental College of Pharmacy. Institutional association does not determine the scientific outcome of individual manuscripts.

Editors are responsible for editorial decisions based on scientific quality, relevance, methodological soundness, ethical standards and the journal's scope.

4. FOR AUTHORS

Guide for Authors

Authors are encouraged to read the complete Guide for Authors before submission.

JHT seeks manuscripts that demonstrate scientific rigor, appropriate methodology, adequate characterization and meaningful contribution to herbal science and technology.

Article Types

JHT considers the following manuscript categories:

9. Original Research Articles
10. Review Articles
11. Systematic Reviews
12. Scoping Reviews
13. Short Communications
14. Methodological and Technical Articles
15. Perspectives
16. Commentaries
17. Editorials

10. Letters to the Editor

Protocols and case reports are not accepted as standard article categories.

Submission and Editorial Process

Manuscripts submitted to JHT undergo an initial editorial assessment followed, where appropriate, by external peer review.

The general process is:

Submission → Editorial Screening → Peer Review → Editorial Decision → Revision, where required → Acceptance → Production → Publication

Editorial screening considers:

- relevance to the journal's scope;
- originality;
- scientific quality;
- methodological appropriateness;
- ethical compliance;
- reporting completeness;
- overall contribution.

Peer Review

JHT uses a double-anonymized peer-review process.

Where external review is undertaken, manuscripts will normally be evaluated by at least two reviewers, although the editorial team may appoint one or three reviewers depending on the nature and circumstances of a submission.

Reviewers are selected according to relevant subject expertise and scientific requirements.

Reviewer selection may consider editorial expertise and appropriate scholarly databases or reviewer resources.

JHT does not routinely accept author-suggested reviewers.

Manuscript Preparation

Authors should prepare manuscripts using clear scientific structure and terminology.

The journal follows a moderate initial formatting approach. Authors are not expected to satisfy unnecessarily restrictive technical formatting requirements before editorial assessment, provided that the manuscript is complete, readable and scientifically organized.

Detailed formatting and production requirements may be applied after acceptance.

References

JHT uses an author-date reference system.

Authors should ensure that:

- all cited sources appear in the reference list;
- every reference-list entry is cited in the manuscript;
- bibliographic information is complete and accurate;
- persistent identifiers such as DOI are provided where available;
- references are relevant and appropriately selected;
- excessive self-citation and citation manipulation are avoided.

The final technical reference format will be specified in the production guidelines.

Word Limits

JHT uses recommended rather than universally rigid manuscript-length limits.

Manuscripts should be sufficiently detailed to communicate the research clearly while avoiding unnecessary length.

Article-specific recommendations may be provided for individual manuscript categories.

Editors may request shortening or restructuring where manuscript length is disproportionate to the scientific contribution.

Article-Specific Requirements

Original Research Articles

Original Research Articles should provide a clearly defined research question and sufficient methodological detail to allow appropriate scientific evaluation.

Depending on the study, manuscripts should include:

- appropriate characterization of research materials;
- experimental design;
- controls;
- sample size or experimental replication;

- statistical analysis;
- relevant analytical validation;
- clear presentation of results;
- conclusions supported by the evidence.

Review Articles

Review Articles should provide a critical and scientifically useful synthesis of the literature rather than a descriptive compilation.

Reviews should clearly define:

- the subject and scope;
- literature sources and selection approach where appropriate;
- major scientific findings;
- areas of agreement and uncertainty;
- limitations in the available evidence;
- meaningful conclusions and future research needs.

Systematic Reviews

Systematic Reviews should follow appropriate systematic-review methodology and use PRISMA reporting requirements where applicable.

The manuscript should clearly report the search strategy, eligibility criteria, study selection, data extraction and synthesis methods.

Scoping Reviews

Scoping Reviews should clearly define the research question, information sources, eligibility criteria and mapping or synthesis methodology.

Appropriate reporting standards should be followed.

Short Communications

Short Communications should present concise findings of sufficient scientific interest to warrant rapid communication.

The manuscript should not omit essential methodological or analytical information merely because of its shorter format.

Methodological and Technical Articles

These articles should describe a meaningful methodological or technological development, optimization or validation.

Routine application of established methods without meaningful methodological contribution is generally insufficient.

Perspectives

Perspectives should provide a focused scholarly discussion of an important emerging issue, scientific direction, methodology or technological development relevant to JHT.

Perspectives may be submitted or invited and are subject to editorial assessment.

Commentaries

Commentaries should provide substantive scholarly discussion concerning research, methods, technologies, developments or issues relevant to the journal.

They should contribute informed analysis rather than unsupported opinion.

Editorials

Editorials are primarily commissioned or invited by the editorial leadership, with occasional submissions considered at editorial discretion.

Letters to the Editor

Letters may address published work, methodological issues, emerging scientific developments or other matters of substantive relevance to the journal.

Herbal Material Reporting

For research involving identified plant material, authors should provide adequate botanical information to establish the identity and provenance of the material.

Where applicable, this should include:

- accepted scientific name;
- author citation where relevant;
- family;
- plant part used;
- geographical source;
- collection information;
- authentication details;
- name and affiliation of the person or institution responsible for authentication;
- voucher specimen information where available.

Botanical authentication is required where applicable to the scientific interpretation of the research.

Extract and Preparation Reporting

Authors studying herbal extracts should provide sufficient information regarding preparation to allow the work to be understood and reproduced.

The manuscript should report, as appropriate:

- plant material used;
- plant part;
- extraction or preparation procedure;
- extraction solvent or solvent system;
- extraction conditions;
- extract yield where relevant;
- concentration or dose basis;
- storage conditions;
- relevant characterization.

Plant-part information is required when an extract or herbal material is studied.

Detailed characterization is recommended and should be proportionate to the scientific claims made.

Where biological activity is attributed to a chemically complex extract, authors should provide an appropriate level of characterization to support interpretation of the findings.

Pharmacological and Toxicological Research

Studies evaluating pharmacological or toxicological effects should provide appropriate:

- experimental models;
- controls;
- dosing information;
- route and duration of administration;
- experimental design;
- sample size or replication;
- statistical analysis;
- relevant mechanistic or biological evidence.

Claims of therapeutic activity should remain proportionate to the evidence generated.

Formulation and Drug-Delivery Research

Formulation studies should provide sufficient information regarding:

- composition;
- formulation design;
- preparation method;
- optimization strategy where applicable;
- physicochemical properties;
- performance evaluation;
- stability where relevant;
- analytical methods;
- release or permeation methodology where applicable;
- appropriate controls and comparison formulations.

Formulation studies should demonstrate meaningful scientific or technological contribution rather than merely reporting preparation and basic characterization of a conventional dosage form.

Analytical and Standardization Research

Analytical studies should provide sufficient information regarding:

- analytical method;
- instrumentation;
- sample preparation;
- standards or reference materials;
- validation parameters where applicable;
- specificity/selectivity;
- accuracy and precision;
- relevant sensitivity parameters;
- robustness where appropriate.

Methods intended for quality control or standardization should be supported by appropriate validation.

Computational Research

Computational research should provide adequate methodological transparency to allow the work to be evaluated and, where feasible, reproduced.

Studies should clearly identify:

- databases and data sources;
- software and relevant versions;
- computational methods;
- parameters;
- assumptions;
- analytical workflow.

Computational findings should have meaningful relevance to herbal science and, where appropriate, biological or experimental support.

Routine Antioxidant and Antimicrobial Studies

Studies reporting routine antioxidant or antimicrobial activity should provide a clear scientific rationale and meaningful contribution.

Studies consisting primarily of routine screening without appropriate biological rationale, methodological advancement, comparative context or scientific interpretation may receive lower editorial priority.

Human and Animal Research

Research involving humans or animals must comply with applicable ethical requirements.

Authors should provide appropriate ethics information, approvals and consent statements where applicable.

Animal studies should follow relevant reporting standards. ARRIVE guidance is recommended where applicable.

Clinical studies involving herbal products will be considered only where they are scientifically relevant to the scope of JHT and satisfy appropriate ethical and methodological requirements.

Graphical Abstracts and Highlights

Graphical Abstract

A graphical abstract is mandatory for research articles where applicable.

It should communicate the central research question, methodology, principal finding or technological development clearly and without excessive text.

Highlights / Key Points

Highlights are mandatory where requested for the relevant article category.

They should concisely communicate the principal scientific or technological contributions of the work.

Data and Reproducibility

JHT encourages transparent reporting and reproducible research.

A Data Availability Statement is required where applicable, particularly for research involving datasets or substantial underlying data.

Authors should indicate:

- where supporting data can be accessed;
- whether data are publicly available;
- any restrictions on access;
- the reason for restricted access where applicable.

Raw datasets should be made available where appropriate and feasible. Where public deposition is not appropriate, authors should explain the applicable limitations.

Declarations

Manuscripts should include appropriate declarations, including where applicable:

- Funding
- Conflicts of Interest
- Ethics Approval
- Informed Consent
- Consent for Publication
- Data Availability
- Author Contributions
- Acknowledgements

Authors are responsible for ensuring that declarations accurately reflect the work.

Artificial Intelligence and AI-Assisted Tools

JHT recognizes that artificial intelligence and AI-assisted technologies may be used in research and manuscript preparation.

AI-assisted tools may be used for activities such as language improvement or other permitted forms of assistance, provided that the authors remain fully responsible for the submitted work.

Where AI tools have been used in a manner requiring disclosure, authors must provide an appropriate declaration describing their use.

AI tools cannot be listed as authors.

Authors remain responsible for:

- accuracy of the manuscript;
- originality;
- appropriate citation;
- verification of generated information;
- protection of confidential information;
- ethical compliance;
- the final scientific content.

AI-generated material must not replace genuine scholarly authorship or scientific responsibility.

Originality and Duplicate Publication

Submitted manuscripts must be original and must not be under consideration by another journal.

Authors must disclose relevant previous dissemination or closely related publications where appropriate.

JHT does not permit:

- duplicate publication;
- simultaneous submission;
- substantial undisclosed overlap;
- plagiarism;
- fabricated or falsified content.

Publication Ethics and Research Integrity

JHT expects authors, editors and reviewers to uphold high standards of publication ethics and research integrity.

The journal addresses, as applicable:

- plagiarism;
- duplicate submission;
- duplicate publication;
- fabrication;
- falsification;
- inappropriate image manipulation;
- authorship disputes;
- undisclosed conflicts of interest;
- peer-review manipulation;
- citation manipulation;
- ethical approval deficiencies;
- corrections;
- retractions.

Concerns regarding research integrity may be investigated and addressed in accordance with appropriate scholarly publishing principles.

Submission Checklist

Before submission, authors should confirm that:

- The manuscript falls within the scope of JHT.
- The manuscript is original and is not under consideration elsewhere.
- All authors have approved the submitted version.
- Author information is complete and accurate.
- Plant materials have been appropriately identified where applicable.
- Plant part and preparation/extraction information are reported where applicable.
- Relevant experimental methods are adequately described.
- Appropriate controls and statistical methods are provided.
- Ethical approvals are reported where applicable.
- Tables and figures are appropriately labelled.
- References are complete and accurate.
- Required declarations are included.
- AI use has been disclosed where applicable.
- Data availability has been addressed where applicable.
- The manuscript complies with the relevant article-type requirements.

Manuscript / Article Format

Authors should use clear headings and subheadings appropriate to the study. The following structures are recommended.

Letters to the Editor

Letters should be concise and focused. They may address a published article, methodological issue, emerging development or other matter of substantive relevance to JHT. References and declarations should be included where applicable.

Editorials

Editorials should follow the structure specified by the editorial office for the particular assignment. They may include an introductory context, focused discussion and concluding perspective, followed by relevant declarations and references where applicable.

Perspectives and Commentaries

These articles should provide a focused scholarly analysis rather than unsupported opinion. Perspectives and Commentaries may be submitted or invited and remain subject to editorial assessment.

Recommended order:

1. Title
2. Abstract, where appropriate
3. Keywords
4. Main text with appropriate thematic headings
5. Conclusions or concluding perspective
6. Declarations
7. References

Methodological and Technical Articles

The manuscript should clearly identify the methodological or technological problem addressed, describe the development or optimization process and provide appropriate validation or performance evidence.

Recommended order:

1. Title
2. Abstract
3. Keywords
4. Introduction
5. Materials and Methods / Method Development
6. Results and Validation
7. Discussion
8. Conclusions
9. Declarations
10. References
11. Supplementary material, where applicable

Short Communications

The shorter format does not justify omission of essential methodological information.

Short Communications should normally contain:

Title; Abstract; Keywords; Introduction; Materials and Methods; Results and Discussion; Conclusions; Declarations; References; and relevant Tables/Figures.

Scoping Reviews

The manuscript should clearly explain the research question, information sources, eligibility criteria, study-selection process and approach used to map or synthesize the evidence.

Recommended order:

1. Title
2. Abstract
3. Keywords
4. Introduction
5. Methods
6. Results
7. Discussion
8. Conclusions
9. Declarations
10. References
11. Supplementary material, where applicable

Systematic Reviews

Authors should report the search strategy, information sources, eligibility criteria, study selection, data extraction and synthesis methods. PRISMA reporting is required where applicable.

Recommended order:

1. Title
2. Abstract
3. Keywords
4. Introduction
5. Methods
6. Results
7. Discussion
8. Conclusions
9. Declarations
10. References
11. Supplementary material, where applicable

Review Articles

Reviews should synthesize and critically evaluate the literature rather than provide a simple descriptive catalogue of studies.

Recommended order:

1. Title
2. Abstract
3. Keywords
4. Introduction
5. Main thematic sections
6. Critical discussion / research gaps
7. Conclusions
8. Declarations
9. References
10. Tables/Figures, where applicable

Original Research Articles

Title: State the main subject and contribution of the study clearly and concisely. Avoid unsupported claims and unnecessary abbreviations.

Abstract: Provide a concise summary of the background/rationale, objective, methods, principal results and conclusion. The abstract should be understandable without referring to the main text.

Keywords: Provide relevant terms that represent the principal subject, methods, materials and scientific concepts of the article.

Introduction: Establish the scientific background, identify the knowledge gap or problem, explain the rationale and state the objective or hypothesis of the study.

Materials and Methods: Describe materials, botanical authentication where applicable, plant part, extraction/preparation, chemicals and reagents, experimental design, controls, biological models, formulation procedures, analytical methods, statistical analysis and ethical approvals, as applicable. Provide enough detail to support evaluation and reproducibility.

Results: Present the findings clearly and logically. Avoid unnecessary repetition of information already provided in tables or figures.

Discussion: Interpret the findings in relation to existing evidence, explain their scientific significance, address limitations and distinguish demonstrated findings from hypotheses or future possibilities.

Conclusions: State the principal conclusions supported by the study. Do not introduce claims that are not supported by the results.

Recommended order:

1. Title
2. Abstract
3. Keywords
4. Introduction
5. Materials and Methods
6. Results
7. Discussion
8. Conclusions
9. Declarations
10. References
11. Tables
12. Figure legends
13. Figures
14. Supplementary material, where applicable

Declarations — Suggested Wording

The following wording may be used where applicable. Authors should modify the statements to accurately reflect their study and circumstances.

AI and AI-Assisted Technologies

Where no AI-assisted tools requiring disclosure were used:

“No artificial intelligence or AI-assisted technologies were used in the preparation of this manuscript.”

Where AI-assisted tools were used in manuscript preparation:

“During the preparation of this manuscript, the authors used [name of tool/service] for [specific purpose].”

The authors reviewed and edited the content as needed and take full responsibility for the content of the published article.”

Acknowledgements

If there are no acknowledgements:

“Not applicable.”

Where applicable:

“The authors thank [name/institution] for [specific contribution].”

Author Contributions

Authors should describe individual contributions using clear role-based wording. For example:

“[Author initials]: Conceptualization, Methodology, Investigation, Data curation, Writing – original draft.

[Author initials]: Validation, Supervision, Writing – review & editing. All authors read and approved the final manuscript.”

Data Availability

If data cannot be shared:

“The data generated and/or analyzed during the current study are not publicly available because [reason], but may be available from the corresponding author upon reasonable request, subject to applicable restrictions.”

If publicly deposited:

“The datasets generated and/or analyzed during the current study are available in the [repository name] repository under [DOI/accession number].”

If data are available on request:

“The data generated and/or analyzed during the current study are available from the corresponding author upon reasonable request.”

Consent for Publication

Where required:

“Written informed consent for publication was obtained from the participant(s).”

If not applicable:

“Consent for publication was not applicable to this study.”

Informed Consent

If required and obtained:

“Written informed consent was obtained from all participants before participation in the study.”

If not applicable:

“Informed consent was not applicable to this study.”

Ethics Approval

If approval was obtained:

“This study was approved by the [full name of ethics committee/institutional review board], [institution], under approval number [XXXX] on [date].”

If ethics approval was not required:

“Ethical approval was not required for this study because [brief reason].”

Conflicts of Interest

If a conflict exists:

“[Author name] declares [nature of relationship/conflict] with [organization]. The remaining authors declare no conflicts of interest.”

If there are no conflicts:

“The authors declare that they have no conflicts of interest.”

Funding

If funding was received:

“This work was supported by [Funding Agency] under Grant No. [XXXX].”

If there was no external funding:

“This research received no external funding.”

General Formatting Requirements

- Submit the manuscript as an editable Word document unless the submission system specifies another format.
- Use a clear, readable font and consistent heading hierarchy.
- Number sections and subsections consistently where numbering is used.
- Define abbreviations at first use and avoid unnecessary abbreviations.
- Use SI units where applicable.
- Use standard scientific nomenclature and italicize taxonomic names appropriately.
- Report statistical methods clearly and provide appropriate measures of uncertainty or variation.
- Tables should be editable and numbered consecutively.
- Figures should be numbered consecutively and supplied at appropriate resolution.
- Figure legends should provide enough information to understand the figure without repeatedly referring to the main text.
- Supplementary files should be clearly identified and referenced in the manuscript.
- Authors should ensure that all tables and figures are cited in the text.
- References should follow the JHT author-date style and be checked for accuracy.
- The corresponding author should ensure that all submitted files are complete and consistent.

5. ARTICLES

Articles

The Articles section provides access to published research and other scholarly content appearing in the Journal of Herbal Technologies.

Latest Articles

[Published articles will appear here]

Search Articles

Users will be able to search and filter articles by:

- keyword;
- title;
- author;
- subject area;
- article type;
- publication date.

Subject Areas

Articles may be browsed according to the eight principal JHT scope areas.

Individual Article Page

Each published article should have a dedicated permanent page containing, where applicable:

- article title;
- authors;
- affiliations;
- ORCID identifiers;
- abstract;
- keywords;
- article type;
- publication date;
- DOI;
- full text;
- PDF;
- figures;
- tables;
- references;
- funding statement;
- conflict-of-interest statement;
- ethics statement;
- data availability statement;
- citation information.

Structured article metadata should be maintained to support scholarly discovery and indexing.

Archive

The archive will provide access to published journal content organized by publication period.

Archive: [TO BE POPULATED AFTER LAUNCH]

Special Issues

Special issues may be introduced as the journal develops.

Proposals will be evaluated by the editorial leadership and relevant editorial representatives.

Special-issue manuscripts will be subject to the same scientific and peer-review standards as regular submissions.
